JUMO LOGOSCREEN nt

Paperless recorder with TFT display, Ethernet and USB interfaces

Brief description

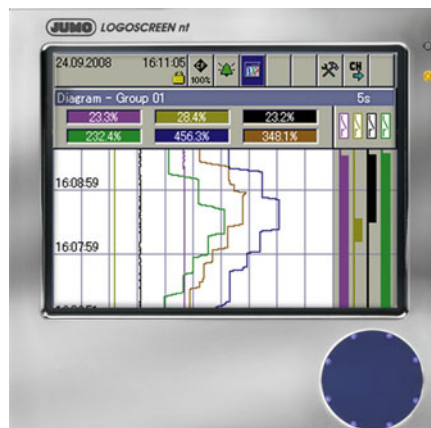

The LOGOSCREEN nt represents a new generation of paperless recorders from JUMO that stand out through their modular design for the acquisition of measurement data (3 to 18 measurement inputs can be implemented internally), their innovative operating concept and high standards of security to prevent unauthorized access and manipulation of the stored data.

In the LOGOSCREEN nt, data can be visualized in process images as measurement curves, as a bar graph or in alphanumeric form.

Powerful PC programs are available for analyzing and evaluating the archived data, and for configuring the LOGOSCREEN nt.

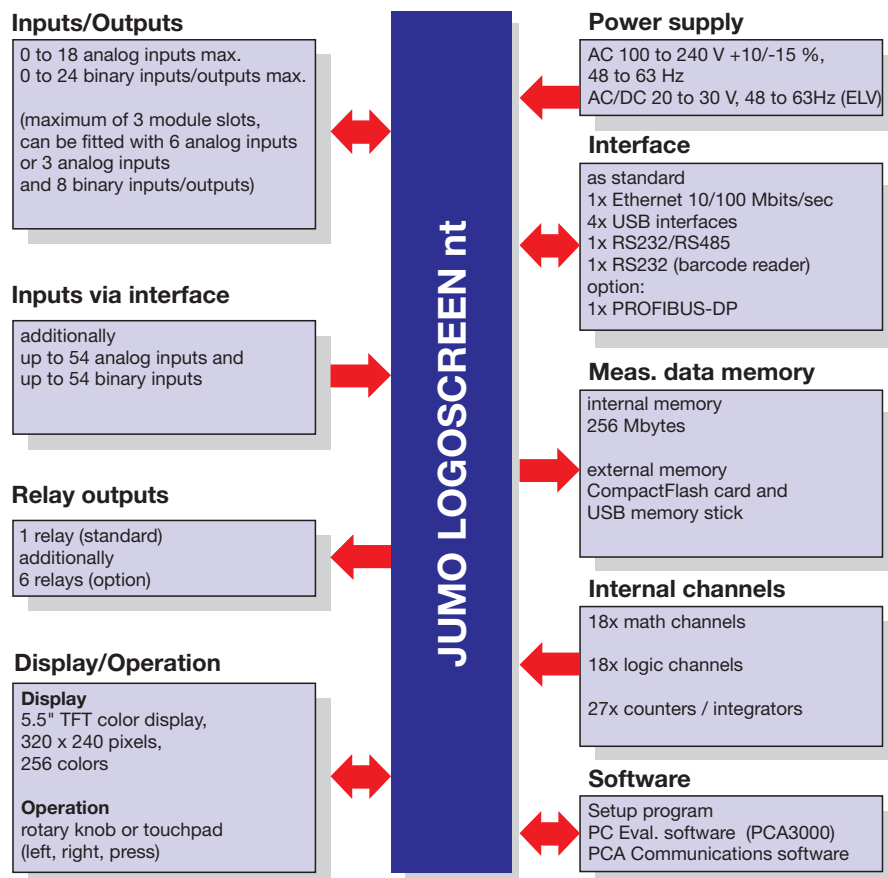

Type 706581/...

Type 706581/...,443(444)
(Stainless steel front Ex)

Block structure

Key features

- Easy operation by control knob or touchpad
- Measurement data storage on CompactFlash memory card or USB memory stick
- Automatic read-out of data through the PCA Communications Software (PCC)
- Interface to SCADA systems, to PLC controls and PC systems
- Integrated web server
- Simultaneous recording of up to 3 batch reports
- Batch control (start, stop, texts) through barcode reader
- Modbus master function
- ATEX approval with stainless steel front

Ex II 2G Ex px IIC
 Ex II 2D Ex px IIIC

- AMS2750/CQI-9 (extra code)

Approvals/marks of conformity (see Technical data)

Control knob, to rotate and press.

CompactFlash memory card and USB interfaces behind housing door.

Instrument description

Hardware

The paperless recorder is built to a modular design. The basic type consists of a PSU board (incl. relays) and a CPU board (incl. Ethernet and RS232/RS485 interfaces and an RS232 interface for barcode reader and USB interface connection).

Module slots 1, 2 and 3 can be fitted with input modules, each with 6 analog inputs or 3 analog inputs and 8 binary inputs/outputs. Alternatively, module slot 3 can be fitted with a relay module that has 6 relays. Optionally, the PSU board can be equipped with a PROFIBUS-DP interface.

Data recording

Measurements are acquired continuously in a 125msec sampling cycle. Based on these measurements, reports are compiled and limits checked.

The measurements are transferred to the main memory of the instrument, according to the programmable storage cycle and stored value (maximum, minimum, average, min&max, instantaneous value or economy mode).

The paperless recorder saves the data in groups, and an input can be assigned to several groups (maximum 9).

Main memory (SRAM)

The data stored in the SRAM are regularly copied to the internal memory in 20 kbyte blocks.

Internal memory

When a block in the main memory has been filled, it is copied to the internal memory. The internal memory has a capacity of max. 256 Mbytes.

Every write action is monitored, so that any errors in saving the data can be immediately identified.

The instrument monitors the capacity of the internal memory and activates one of

the "memory alarm" signals when the capacity falls below the configurable residual capacity level. These signals can be used, for instance, to operate the alarm relay.

The memory is written as a ring memory, i. e. when the memory is full, the oldest data are automatically overwritten by the new data.

Data from the internal memory can be shown as a history presentation on the recorder. The size of the history memory can be configured.

Data transfer to the PC

Data transfer from the paperless recorder to a PC is made by means of the external CompactFlash memory card (not available with stainless steel front), the USB memory stick or via one of the interfaces (USB device, RS232, RS485, Ethernet).

Data security

The data are stored in coded form in a proprietary format. This ensures a high level of data security.

If the paperless recorder is disconnected from the supply, then:

- RAM and clock time are buffered by a lithium battery (ex-factory) ≥ 10 years or with a storage capacitor ≥ 2 days (ambient temperature 0 to $+45$ °C),
- measurement and configuration data in the internal memory will not be lost.

Recording duration

Depending on the configuration of the instrument, the duration of the recording can vary over a considerable range (from a few days up to several months).

Report

For each channel of a group, a report (maximum/minimum/average or integrator) can be run over defined periods.

Batch reports

Up to three batch reports can be created simultaneously in the recorder. The measurement data, start, end and duration of each batch can be displayed together with a batch counter and freely definable texts, both on the recorder and within the PC Evaluation Software PCA3000.

On request, a barcode reader can be used to start batches and read in batch texts.

Limit checkline

changeover of operating mode

Over/underlimit conditions trigger alarms. An alarm can be used, for instance, as a control signal for changing over the operating mode.

The storage cycle and stored value can be configured separately for all three operating modes.

With the help of the alarm delay function, brief occurrences or over/underlimit conditions can be filtered out, with the result that no alarm is generated.

Normal operation

If the instrument is **not** in timed or event operation, normal operation is active.

Event operation

Event operation is activated/deactivated by a control signal (binary input, group/combo combination alarm, ...). As long as the control signal is active, the instrument is in event operation.

Timed operation

Timed operation is active on a daily basis within a programmable time period. The operating modes have different priorities.

Counters/integrators

27 additional internal channels are available for use as counters, integrators, operating time counters or for flow measurements.

These counters are controlled through the binary inputs, the alarms, or via the logic channels. The analog channels can be used for the integrators.

The numerical indication is shown in a separate window, with a maximum of 9 digits. The acquisition period can be selected as: periodic, daily, weekly, monthly, yearly as well as external, total (overall count) or daily from ... to.

A maximum of 6 binary inputs are available as high-speed counters with a 10 kHz sampling cycle rate.

Math/logic module (extra code)

The module for math and logic (18 channels each) enables, for instance, the combination of analog channels with one another, and also the combination of analog channels with counters and binary inputs. The operators available for formulae are: +, -, *, /, SQRT(), MIN(), MAX(), SIN(), COS(), TAN(), **, EXP(), ABS(), INT(), FRC(), LOG(), LN(), humidity, moving average or !, &, |, ^, as well as (and).

The math and logic module can only be configured through the setup program.

Time server (SNTP)

The time server function (SNTP = simple network time protocol) enables the synchronization between the time of the paperless recorder with external time signals (server; e.g. atomic clock).

Mobus slave monitoring of external inputs

If active Modbus slave monitoring (timeout monitoring) is the case then the communication (Modbus protocol) between the slave (paperless recorder) and the master with regard to the external analog and binary inputs is monitored. If no communication takes place within the configured time then an alarm message is displayed and entered into the alarm and event list.

Operation and configuration

On the recorder

The instrument is configured from the control knob (or with stainless steel front, from the touchpad) on the front panel under menu guidance.

-  Shift current menu position (cursor) to the left or upwards.
-  Shift current menu position (cursor) to the right or downwards.
-  When the control knob is pressed, the current function is executed.

Example:

 Rotate control knob to the left.

 Press control knob.

Result: The menu for the alarm and event list is called up.

 Rotate control knob to the left.

 Press control knob.

Result: The menu for the alarm and event list is closed again.

 Integrated user lists (different users with different authorizations) protect the recorder against unauthorized access.

Through the setup program

As an alternative to the configuration from the control knob on the recorder, the instrument can also be configured through the setup program.

Communication between the setup program and the paperless recorder is made through the:

- USB device interface,
- serial interface,
- Ethernet interface,
- CompactFlash memory card or
- USB memory stick.

The configuration data can be archived on a data storage medium and output to the printer.

Operating language

Two languages (see order details) are integrated in the instrument ex-factory. The setup program is used to exchange the operator language.

The languages available at the moment are: English, French, German, Russian, Japanese, Chinese, Italian, Romanian, Czech, Hungarian, Polish, Greek, Spanish, and Portuguese.

Other language versions (with Unicode capability) can be created.

Process images (editor)

The setup program can create process images (max. 9; one process image for each group) and transfer them to the paperless recorder for display. Up to 25 objects (images, analog channels, binary channels, texts, ...) can be used in a process image.

One process image is integrated in the paperless recorder ex-factory.

Visualization on the instrument

Operator level

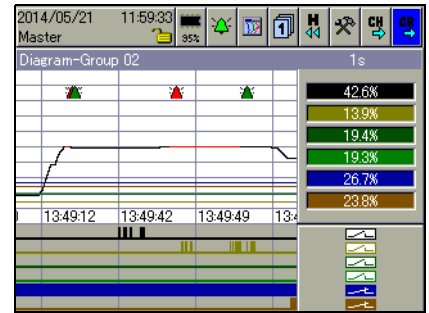

- Selection of visualization

Vertical diagram

- Recorder chart presentation of analog and binary channels
- Display of scaling and limit markers of a channel (can be switched on/off)
- Numerical display of current analog channels

Horizontal diagram

- Functionality corresponds to the vertical appearance
- Visualization without analog signals is also possible (either horizontally or vertically)

Bar graph presentation

- Bar graph presentation of analog channels
- On/Off presentation of binary channels
- Display of current analog channels with scaling and limit markers
- Color change of bar graph to red when limits are infringed

Numerical presentation

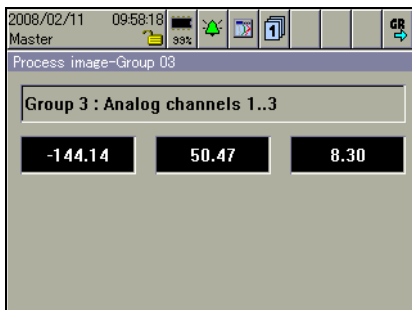

- Large numerical presentation of analog channels, including the channel name and description
- Each analog channel can be switched to the foreground
- On/Off presentation of binary channels

Numerical 1-channel presentation

- Clear presentation of an analog channel
- An analog input is shown simultaneously as a bar graph and a number
- Display of channel name and description
- Display of scaling and limit markers

Process image

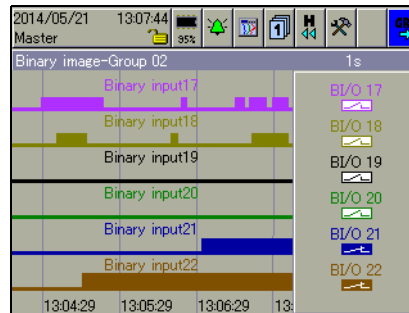

- Freely configurable presentation (through the setup program) of analog and binary signals with background pictures
- One process image for each group

Binary presentation (vertical)

- On/Off presentation of binary channels

Binary presentation (horizontal)

- On/Off presentation of binary channels

Report

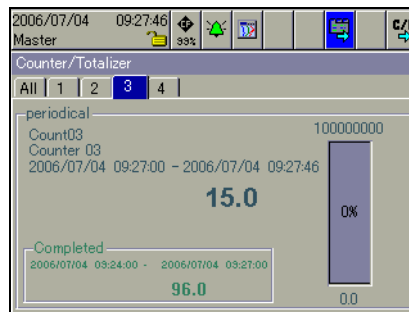

- Display of different reports for the analog channels of a group
- Details of minimum, maximum, average/integral values and time period
- Display of the previous report

Batch reports

- 3 batches documented simultaneously
- Changeover between current and completed batch reports
- Electronic signature is possible
- Batch texts via interface and barcode reader, among others

Counter/integrator presentation

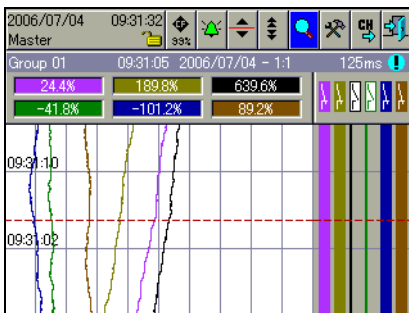

- Presentation of up to 27 counters or integrators
- Changeover between individual and overall display
- Display of the current and the most recently completed count

Group selection

- Up to 9 groups are configurable
- Up to 6 analog and 6 binary channels can be shown for each group
- Measurement signals can be used in several groups

History presentation

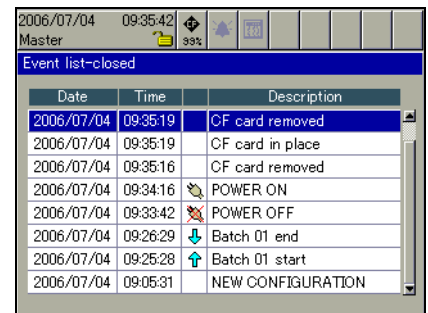

- All stored measurement data are shown as curves at different zoom levels
- Display of scaling and limit markers of a channel
- Numerical display of the measurements of the analog channels at the cursor position
- Shifting of the visible section within the stored measurement data

Presentation of alarm lists

- Display of current alarms
- For the instrument as a whole or batch-related
- Up to 150 entries visible on the recorder

Presentation of event lists

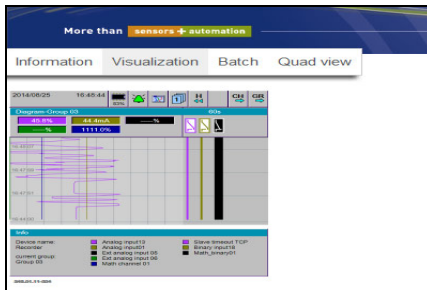

- Display and storage of events and alarms
- For the instrument as a whole or batch-related
- Up to 150 entries visible on the recorder

Configuration

- Configuration on the recorder itself, by rotating and pressing the control knob
- Configuration through the setup program

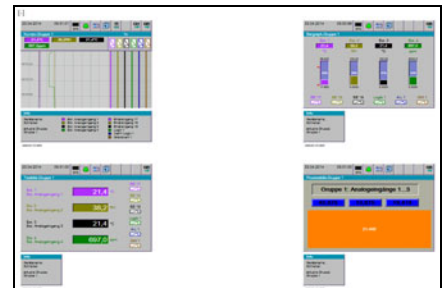

Visualization through the web server

- Online visualization of a recorder
- Selection of customized HTML pages (created upon request)
- Control via latest browser version such as Internet Explorer 11 or above

- Navigation through the different recorder visualizations (curves, bar graph, text, process, binary; but no report)
- Active batch protocol available via menu

- Max. four recorders or four different visualizations simultaneously

PC programs

PC Evaluation Software (PCA3000)

The PC Evaluation Software (PCA3000) is a program which runs under Microsoft Windows XP, Windows Vista, and Windows 7 (32 bit or 64 bit), and Windows 8 (32 bit or 64 bit), and is used to manage, archive, visualize and evaluate the recorder data.

- The data from differently configured instruments are recognized by the PC Evaluation Software and stored in an archive database. All management is fully automatic. The user only has to manually allocate an identifier (supplementary description).
- The user can at any time gain access to certain data sets which can be distinguished by the identifier. It is also possible to restrict the time periods to be evaluated.
- Any analog or binary channels of a paperless recorder (even from different groups) can subsequently be combined into PCA groups in PCA3000.
- Since each group is displayed in a separate window, several groups can be shown simultaneously on the screen and compared.
- Operation by mouse or keys.
- Using the export filter, it is possible to export the stored data, so that they can be processed in other programs such as Excel.
- The PC Evaluation Software PCA3000 has network capability, i.e. several users can obtain data from the same archive file (*.177) in a network directory, independently of each other.

PCA Communications software (PCC)

- Data can be read out from the recorder via the USB device interface, the serial interface (RS232/RS485) or via the Ethernet interface. The data can be read manually or automatically (e.g. daily at 23.00 hrs).
- Data can also be retrieved via remote control, through a modem.

Functional overview

1. Retrieve measurement data from the recorder.
2. Store measurement data in archive files (*.177).
3. Activate "automatic printout" in PCA3000.
The print template is selected within PCC.
4. Read the print template. Print templates are created within PCA3000.
5. Data transfer from archive.
6. Determine the content defined in the print template.
7. Use the determined content in the defined design.
8. Output the completed design in the defined formats.

Interfaces

- USB interfaces (standard)
- RS232/RS485 interface (standard)
- RS232 interface for barcode reader (standard)
- Ethernet interface (standard)
- PROFIBUS-DP interface (extra code)

USB interfaces

With USB interfaces, a distinction is made between the host and the device interface. A USB memory stick can be attached to the host interface. The device interface, in conjunction with a standard commercial USB cable, is used to operate the setup program.

The paperless recorder without stainless steel front has host and device interfaces connected in parallel on both the front and back panels, of which only one of each type can ever be used. The paperless recorder with stainless steel front has only one host and one device interface at the rear panel.

RS232/RS485 interface

Current process data, as well as specific device data, can be read out via the RS232 or RS485 interface.

Data saved to the internal memory can also be read out in conjunction with the PC Evaluation Software PCA3000 and the PCA Communications Software (PCC).

The RS232 interface permits a maximum lead length of 15 m, the RS485 interface 1.2 km.

Connection is by a 9-pin SUB-D connector on the back of the instrument. Modbus (master and slave) protocols are available, and the transmission mode used is RTU (Remote Terminal Unit).

RS232 for barcode reader

A barcode reader can be attached to the interface. The barcode reader can be used to start or stop batch reporting, and to set batch texts (customer information, batch number...).

The barcode reader can also be operated via the RS232/RS485 interface, and the RS232 interface for the barcode reader can also be used as a Modbus master or slave.

	USB Host/Device	RS232 RS485	Ethernet	PROFIBUS-DP	External CF card
Read current measurement data	yes (device only)	yes	yes	yes	no
Write current measurement data	no	yes	yes	yes	no
Read out stored measurement data	yes	yes	yes	no	yes
Read /write configuration	yes	yes	yes	no	yes
Write user list	yes	yes	yes	no	yes

Ethernet interface

The Ethernet interface can be used in local networks for the communication between the recorder and the setup program and the PCA Communications Software. The IP address is set permanently through the configuration on the instrument or in the setup program, or can be automatically received from a DHCP server.

The integrated web server allows simultaneous access by several PCs to 3 HTML and 3 batch pages.

Transmission protocol: TCP/IP
Network type: 10BaseT, 100BaseT

PROFIBUS-DP interface

The recorder can be integrated into a fieldbus system according to the PROFIBUS-DP standard via the PROFIBUS-DP interface. This PROFIBUS version is especially designed for communication between automation systems and distributed peripheral devices at the field level.

Data are transmitted serially according to the RS485 standard, with a maximum 12 Mbits/sec.

Using the project design tool that is included in the delivery (GSD generator; GSD = device master file), an application-specific GSD file is created, which is used to integrate the recorder into the fieldbus system.

External CompactFlash memory card (CF)

For paperless recorders without stainless steel front, the external CompactFlash memory card (CF) is used to transfer the data from the internal memory to the PC. Configuration data can be created on the PC and then transferred to the recorder by means of the memory card.

On the PC side, data on the card is accessed using a read/write device (CompactFlash reader/writer).

External inputs via interface

The paperless recorder can acquire and store up to 54 external analog inputs and 54 binary inputs.

Furthermore, the interfaces can be used to enter comments in the event list of the recorder.

Stainless steel front (extra code 443 or 444)

The paperless recorder with extra code 443 or 444 (without extra code 350) may be installed in switch cabinets with at least a simplified pressurized enclosure. Under these conditions, use in a potentially explosive atmosphere (max. zones 1 and 21) is authorized from the front.

Notes on installation in Installation Instructions B 706581.4.1 must be complied with and followed.

Paperless recorders with authorization for explosion hazard areas, carry the following mark on the nameplate attached to the instrument.

 II 2G Ex px IIC

 II 2D Ex px IIIC

Caution: If extra code 443 or 444 is present, the CompactFlash memory card can no longer be used for external storage. Measurement data can be read out via one of the interfaces or via a USB memory stick (from the back).

Connection diagram

Rear view with pluggable screw terminals

Instrument variant 1

Module slot 3 (top)
fitted with one relay card.

Module slot 2 (middle)
fitted with 6 analog channels or
3 analog channels and
8 binary inputs/outputs.

Module slot 1 (bottom)
fitted with 6 analog channels or
3 analog channels and
8 binary inputs/outputs.

Instrument variant 2

Module slot 3 (top)
fitted with 6 analog channels or
3 analog channels and
8 binary inputs/outputs.

Module slot 2 (middle)
fitted with 6 analog channels or
3 analog channels and
8 binary inputs/outputs.

Module slot 1 (bottom)
fitted with 6 analog channels or
3 analog channels and
8 binary inputs/outputs.

Instrument variant 3

Module slot 1 to 3

without analog channels,
without binary inputs/outputs,
without relay card

Recorder with die-cast zinc front

Recorder with stainless steel front (extra code 443 or 444)

Panel cut-out

Universal carrying case option - TG-35

Order details

(1) Basic type	
706581	LOGOSCREEN nt with TFT display, Ethernet and USB interfaces
(2) Basic type extension	
0	No software package
1	With software package (setup program, PCA3000, PCC, USB cable)
(3) Language / Setup	
8	Factory setting (German/English)
9	Set to customer specification
(4) Module slot 1	
0	Not used
2	3 analog inputs and 8 digital inputs/outputs
3	6 analog inputs
(5) Module slot 2	
0	Not used
2	3 analog inputs and 8 digital inputs/outputs
3	6 analog inputs
(6) Module slot 3	
0	Not used
1	6 relay outputs
2	3 analog inputs and 8 digital inputs/outputs
3	6 analog inputs
(7) Voltage supply	
25	AC/DC 20 to 30 V, 48 to 63 Hz
33	AC 100 to 240 V +10/-15 %, 48 to 63 Hz
(8) Extra codes memory	
020	Lithium battery for memory buffering (ex-factory)
021	Storage capacitor
(9) Extra codes	
.	Not used
260	Math and logic module
(10) Extra codes housing	
.	Not used
350	Universal carrying case TG-35 ^a
350, 444	Universal carrying case TG-35 ^a and stainless steel front with touchpad
443	Stainless steel front with touchpad, NEMA 4X and Ex
444	Stainless steel front with touchpad Ex
(11) Extra codes	
.	Without extra codes
267	PROFIBUS-DP interface
879	AMS2750/CQI-9 ^b

^a This extra code is only available in combination with voltage supply AC 100 to 240 V. UL, ATEX and NEMA 4X approvals not applicable. The protection type in the carrying case corresponds to IP20, outside IP20D.

^b For the calibration certificate the channels to be checked are to be defined with the thermocouple type and the desired measuring points.

Order code (1) (2) (3) (4) (5) (6) (7) (8) (9) (10) (11)^a

Order example 706581 / [] [] - [] [] [] - [] / [] , [] , [] , []

^a Multiple entries for position 11 are possible. List extra codes in sequence, separated by commas.

Standard accessories

- 1 Installation instructions B 706581.4.1
- 1 Operating instructions B 706581.1
- 4 mounting brackets
- 1 panel seal
- 1 CD with detailed operating instructions and additional documentation

Accessories

- Setup program (incl. USB cable)
- PC Evaluation software PCA3000
- PCA Communications software PCC
- CompactFlash memory cards and USB memory sticks
The CF cards and memory sticks specified by JUMO are tested and designed for industrial applications. Other makes cannot be guaranteed.
